10. Create a unique string by hyphenating the first name, last name , and email of the employees to obtain a new field named UNQ_ID
Return the employee_id, and their corresponding UNQ_ID;

11. Write a SQL query to update the size of email column to 30

12. Write a SQL query to change the location of Diana to London

13. Write a SQL query to find the employee with second and third maximum salary with and without using top/limit keyword

14. Fetch all details of top 3 highly paid employees who are in department Shipping and IT

15. Display employee id and the positions(jobs) held by that employee (including the current position)

16. Display Employee first name and date joined as WeekDay, Month Day, Year
    Eg :

Emp ID	Date Joined
1	Monday, June 21st, 1999

17. Find the average salary of all the employees who got hired after 8th January 1996 but before 1st January 2000 and round the result to 3 decimals

18. Write a SQL query to find the total salaries of employees in Tokyo, excluding those whose first name is Nancy

19. Fetch all details of employees who has salary more than the avg salary by each department.

20. Write a SQL query to find the number of employees and its location whose salary is greater than or equal to 70000 and less than 100000

21. Fetch max salary, min salary and avg salary by job and department.
    Info: grouped by department id and job id ordered by department id and max salary

22. Write a SQL query to find the total salary of employees whose country_id is 'US' excluding whose first name is Nancy

23. Fetch max salary, min salary and avg salary by job id and department id but only for folks who worked in more than one role(job) in a department.

24. Display the employee count in each department and also in the same result.
    Info: * the total employee count categorized as "Total"
    - the null department count categorized as "-" *

25. Display the jobs held and the employee count.
    Hint: every employee is part of at least 1 job

Hint: use the previous questions answer
Sample

JobsHeld	EmpCount
1	100
2	4

26. Display average salary by department and country.

27. Display manager names and the number of employees reporting to them by countries (each employee works for only one department, and each department belongs to a country)

28. Group salaries of employees in 4 buckets eg: 0-10000, 10000-20000,.. (Like the previous question) but now group by department and categorize it like below.
    Eg :

DEPT ID	0-10000	10000-20000
50	2	10
60	6	5

29. Display employee count by country and the avg salary
    Eg :

Emp Count	Country	Avg Salary
10	Germany	34242.8

30. Display region and the number off employees by department
    Eg :

Dept ID	America	Europe	Asia
10	22	-	-
40	-	34	-

    (Please put "-" instead of leaving it NULL or Empty)

31. Select the list of all employees who work either for one or more departments or have not yet joined / allocated to any department

32. write a SQL query to find the employees and their respective managers. Return the first name, last name of the employees and their managers

33. write a SQL query to display the department name, city, and state province for each department.

34. write a SQL query to list the employees (first_name , last_name, department_name) who belong to a department or don't

35. The HR decides to make an analysis of the employees working in every department. Help him to determine the salary given in average per department and the total number of employees working in a department. List the above along with the department id, department name

36. Write a SQL query to combine each row of the employees with each row of the jobs to obtain a consolidated results. (i.e.) Obtain every possible combination of rows from the employees and the jobs relation.
