

MongoDB Setup

MongoDB Setup

MongoDB is the primary database used to store and manage all application data persistently.

Installation

Add the MongoDB tap and install

```
brew tap mongodb/brew
brew install mongodb-community
```

Start the MongoDB service

```
brew services start mongodb-community
```

Install MongoDB Compass (GUI client — recommended for database inspection and query building)

```
brew install --cask mongodb-compass
```

Verify the connection using the shell

```
mongosh
```

Requirements

Component	Type	Notes
mongodb-community	Required	Core database server
mongosh	Required	Included with the install; used to verify the connection
mongodb-compass	Good to have	Not strictly required to run the app, but essential for inspecting data, debugging, and running

Component	Type	Notes
		queries visually

Notes

- Run `brew services list` to confirm MongoDB is active.
- Compass connects to `mongodb://localhost:27017` by default.
- If the service fails to start, check logs with `brew services log mongodb-community`.
